# What is continuous integration?

- ▶ Continuous Integration (CI) is a software engineering practice in which isolated changes are immediately tested and reported on when they are added to a larger code base. The goal of CI is to provide rapid feedback so that if a defect is introduced into the code base, it can be identified and corrected as soon as possible.
- ▶ Three components: continuous builds, test automation and processing of the test results.

Source: TechTarget.com

## Why does the kernel need it?

- ▶ Lots of different platforms (especially in the ARM world)
- ▶ Hard to test all the changes on all platforms
- ▶ Very frequent changes made by the community: new Linux release every two months, thousands of changes
- ▶ Need to detect regressions early
- ▶ Intel 0-day build bot is mainly for x86 platforms

## Why do we need it?

- ▶ Free Electrons contributes to ARM platforms upstream support
- ▶ Cooperation with several ARM processor vendors
- ▶ Many Free Electrons engineers are maintainers of ARM and ARM64 platforms
  - ▶ Grégory Clement: Marvell EBU
  - ▶ Maxime Ripard: Allwinner
  - ▶ Alexandre Belloni: Atmel
  - ▶ Antoine Ténart: Annapurna Labs
- ▶ Keep track of modifications impacting the platforms we maintain

## Components of continuous integration

# KernelCI - Overview

- ▶ <https://kernelci.org>
- ▶ Detects regressions before reaching users
- ▶ 2.000+ boot tests per day on 200+ unique boards

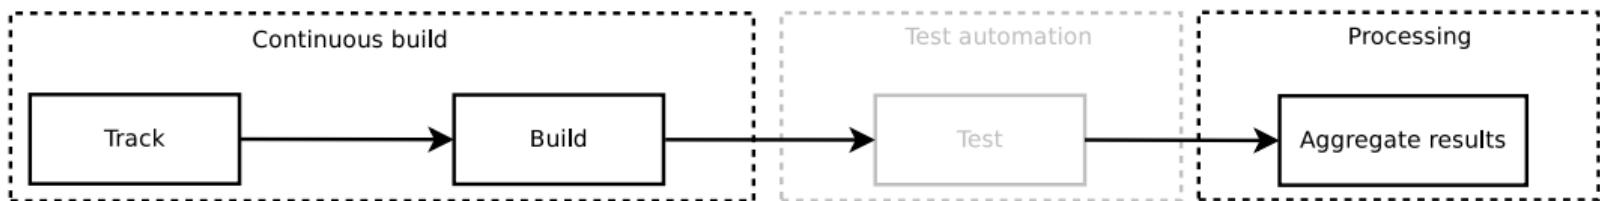

- ▶ Tracks ~20 kernel git repositories for changes
  - ▶ torvalds/linux.git
  - ▶ arm/arm-soc.git
  - ▶ next/linux-next.git
  - ▶ davem/net-next.git
  - ▶ stable/linux-stable.git
  - ▶ ...

- ▶ Builds kernels from tracked repositories
- ▶ Automatically builds all defconfigs for ARM, ARM64 and x86 (and their associated device trees, if any)

# KernelCI - Connection with test automation

- ▶ Works with contributing labs
- ▶ Sends boot tests to labs, collects result and notifies maintainers of failures

## Test automation - Software

Quentin Schulz, Antoine Ténart

# Test automation

- ▶ Controls boards
- ▶ Launches tests on the boards
- ▶ Validates the tests and gathers the results

## LAVA

## Software - LAVA 1/2

KernelCI labs should use Linaro Automated Validation Architecture (LAVA) which:

- ▶ Controls boards
- ▶ Automates boot, bootloader, user-space, ... testing
- ▶ Runs tests simultaneously on all boards
- ▶ Provides API for full automation
- ▶ Validates tests
- ▶ <https://wiki.linaro.org/LAVA>

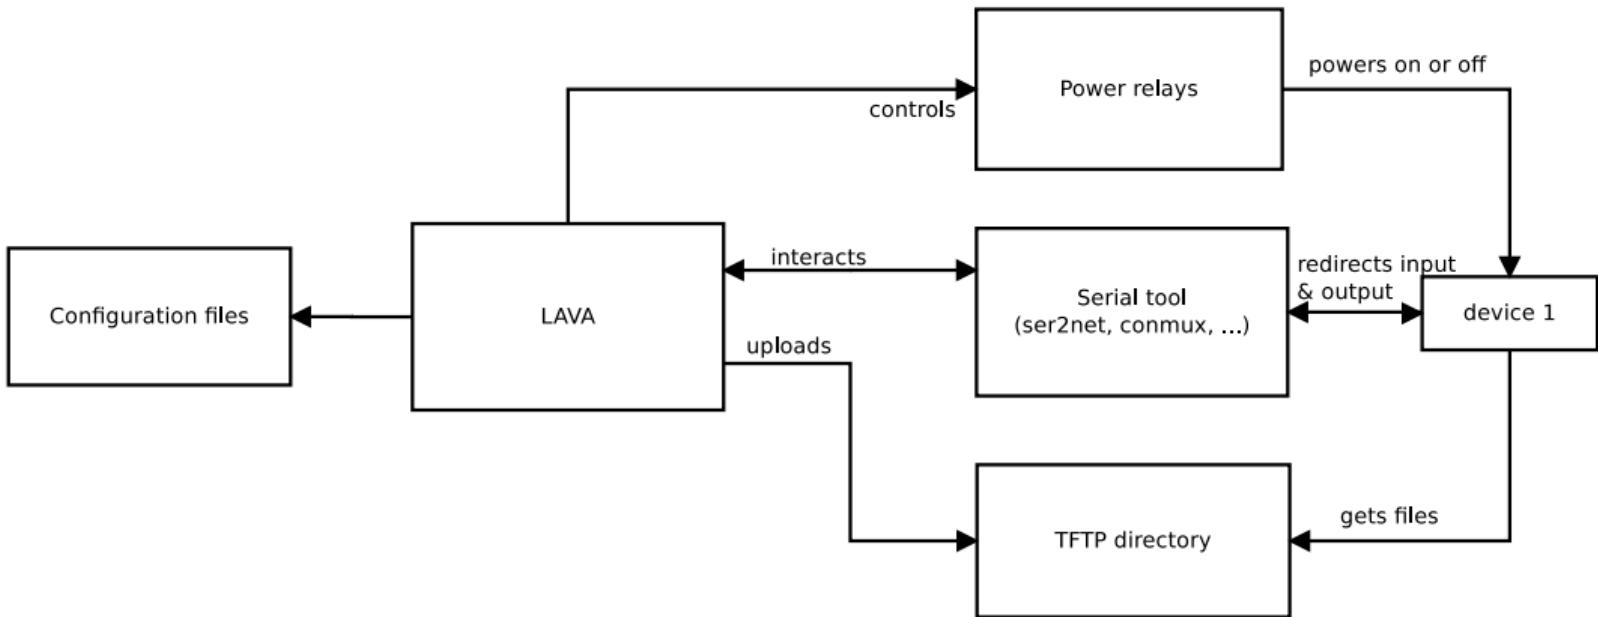

## Software - LAVA 2/2

- ▶ Organized in a master - dispatchers fashion
- ▶ Only 1 master working with N dispatchers
- ▶ The master controls the farm
  - ▶ It handles the API and receives the tests to run
  - ▶ It schedules the tests to run
- ▶ A given dispatcher handles a set of boards
  - ▶ It has the boards' configuration files
  - ▶ It is physically connected to the boards and controls them
  - ▶ It runs the tests
- ▶ We chose to host the master and our only dispatcher on the same machine

# LAVA inner working

## LAVA configuration files - Device

```
$ cat /etc/lava-dispatcher/devices/sun5i-r8-chip_01.conf
device_type = sun5i-r8-chip
hostname = sun5i-r8-chip_01
hard_reset_command = pduclient --daemon localhost --hostname drawer6
                     ↳ --command reboot --port 03 --delay 2
power_off_cmd = pduclient --daemon localhost --hostname drawer6
                  ↳ --command off --port 03 --delay 2
connection_command = telnet localhost 6063
```

# LAVA configuration files - Device type

```
$ cat /etc/lava-dispatcher/device-types/sun5i-r8-chip.conf
client_type = bootloader
send_char = False

z_load_addrs =
    0x42000000
    0x43300000
    0x43000000

boot_cmds_ramdisk =
    setenv autoload no,
    setenv kernel_addr_r "{KERNEL_ADDR}",
    setenv initrd_addr_r "{RAMDISK_ADDR}",
    setenv fdt_addr_r "{DTB_ADDR}",
    setenv ethact "asx0",
    setenv loadkernel "tftp ${kernel_addr_r} ${KERNEL}",
    setenv loadinitrd "tftp ${initrd_addr_r} ${RAMDISK}; setenv initrd_size ${filesize}",
    setenv loadfdt "tftp ${fdt_addr_r} ${DTB}",
    setenv bootargs "console=ttyS0,115200 earlyprintk root=/dev/ram0 ip=dhcp",
    setenv bootcmd "usb start; dhcp; setenv serverip {SERVER_IP}; run loadkernel; run loadinitrd; run loadfdt; {BOOTX}",
    boot

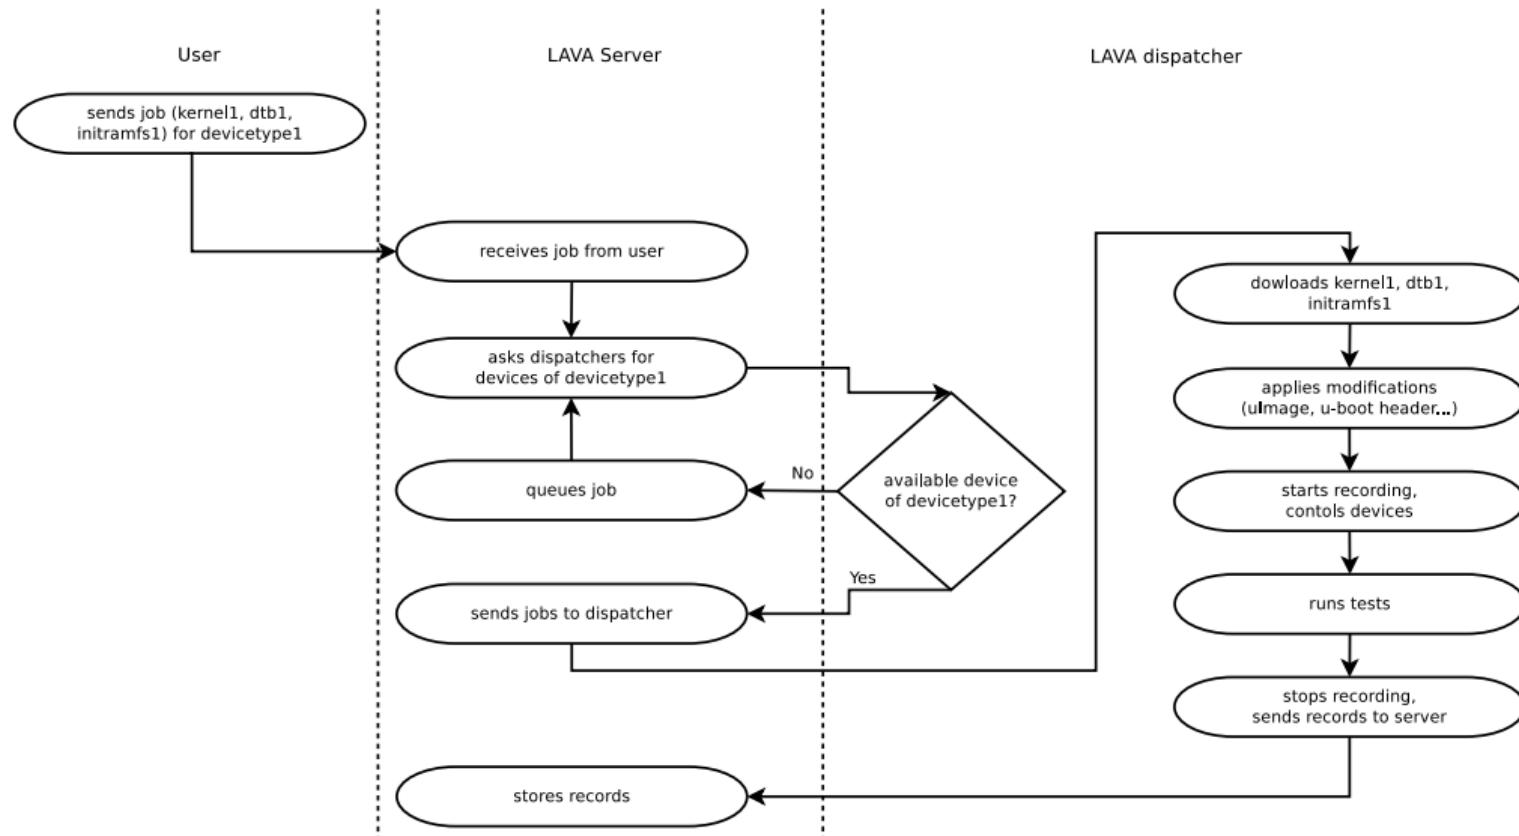

bootloader_prompt = =>

boot_options =
    boot_cmds

[boot_cmds]
default = boot_cmds
```

# Test run in LAVA

## Test automation - Hardware

## Power supply control

# Hardware - Power supply control

We need remotely controlled power supplies:

Figure: Power Distribution Unit

Figure: Remotely controlled relays

Figure: Network controlled multi-sockets

## Hardware - Power supply control

We chose remotely controlled relays because of:

- ▶ their cheap price
- ▶ the number of ports
- ▶ their small footprint
- ▶ their documented TCP protocol
- ▶ their support for virtually any power supply  
(you just need a wire)

## Power supply

# Hardware - Power supply

- ▶ Three different types of boards:
  - ▶ 5V powered boards
  - ▶ 12V powered boards
  - ▶ full ATX powered boards
- ▶ We separate those in two kinds:
  - ▶ non-ATX supplied boards
  - ▶ ATX supplied boards

## Hardware - Power supply of non-ATX supplied boards

- ▶ Different input voltages, two solutions:
  - ▶ one power supply per voltage with enough amperage
  - ▶ one power supply for all voltages with enough amperage
- ▶ We chose ATX power supplies to get all voltages from one power supply

# Hardware - Power supply of non-ATX supplied boards

Corsair VS350 ATX Power Supply						
AC Input Rating	DC Output Rating					
AC Input: 200V - 240V	DC Output	+3.3V	+5V	+12V	-12V	+5Vsb
Current: 5A	Max Load	14A	14A	25A	0.3A	2.5A
Frequency: 47Hz - 63Hz	Maximum Combined Wattage	90W	300W	3.6W	12.5W	Total Power: 350W

Figure: ATX specifications

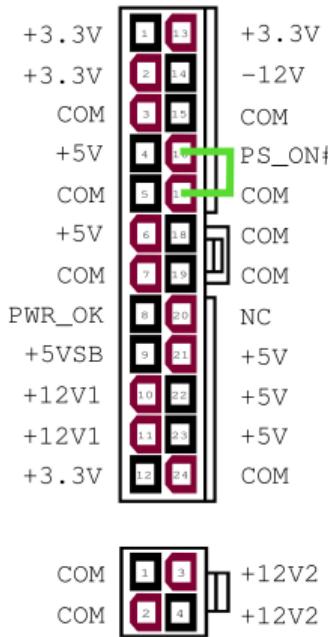

Figure: ATX power supply

Figure: TVS diode

# Hardware - ATX power supply specifics

- ▶ does not always supply power
- ▶ waits for a signal on #PS\_ON or for #PS\_ON to be put to the ground
- ▶ we need it to supply power all the time for non-ATX power supplied boards (the power from ATX power supply to the boards is controlled by per-board relays)
- ▶ we need to control when it supplies power to ATX power supplied boards

Figure: 24-pins ATX connector

## Interaction with boards

## Hardware - Connect to serial

- ▶ Mostly USB cable to board
- ▶ Lots of USB hubs

## Hardware - Get and send files to boards

- ▶ TFTP protocol
- ▶ need of switches and Ethernet cables

## Actual building of the board farm

Quentin Schulz, Antoine Ténart

## Board farm - Specifications

- ▶ Specific location (200\*100\*75cm)
- ▶ Harmless to boards (material choices)
- ▶ Easy to use
- ▶ Allowing evolution
- ▶ As many boards as possible

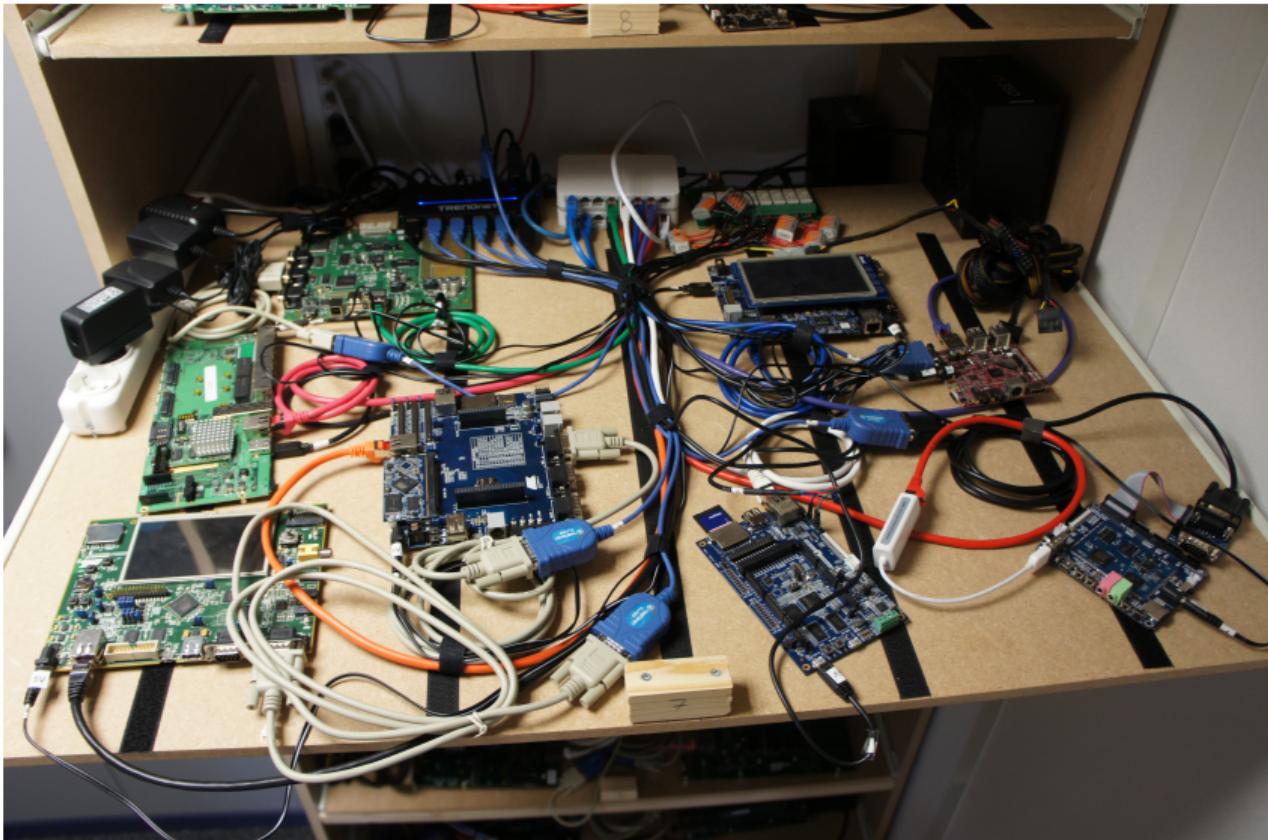

# Board farm - Small drawers

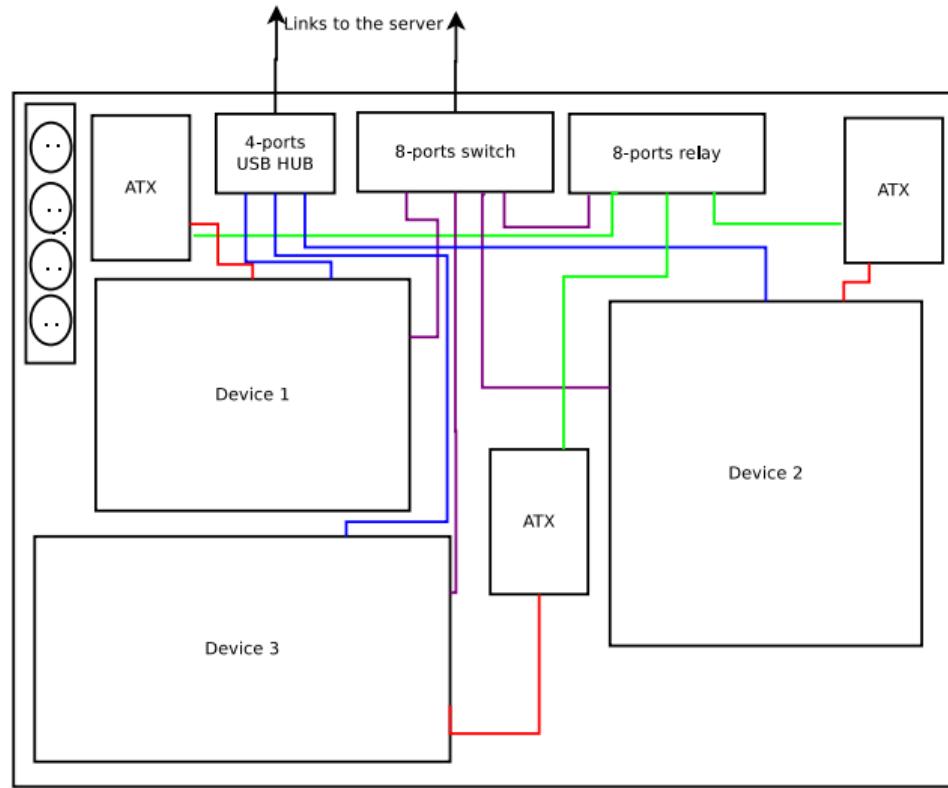

# Board farm - Small drawers - IRL

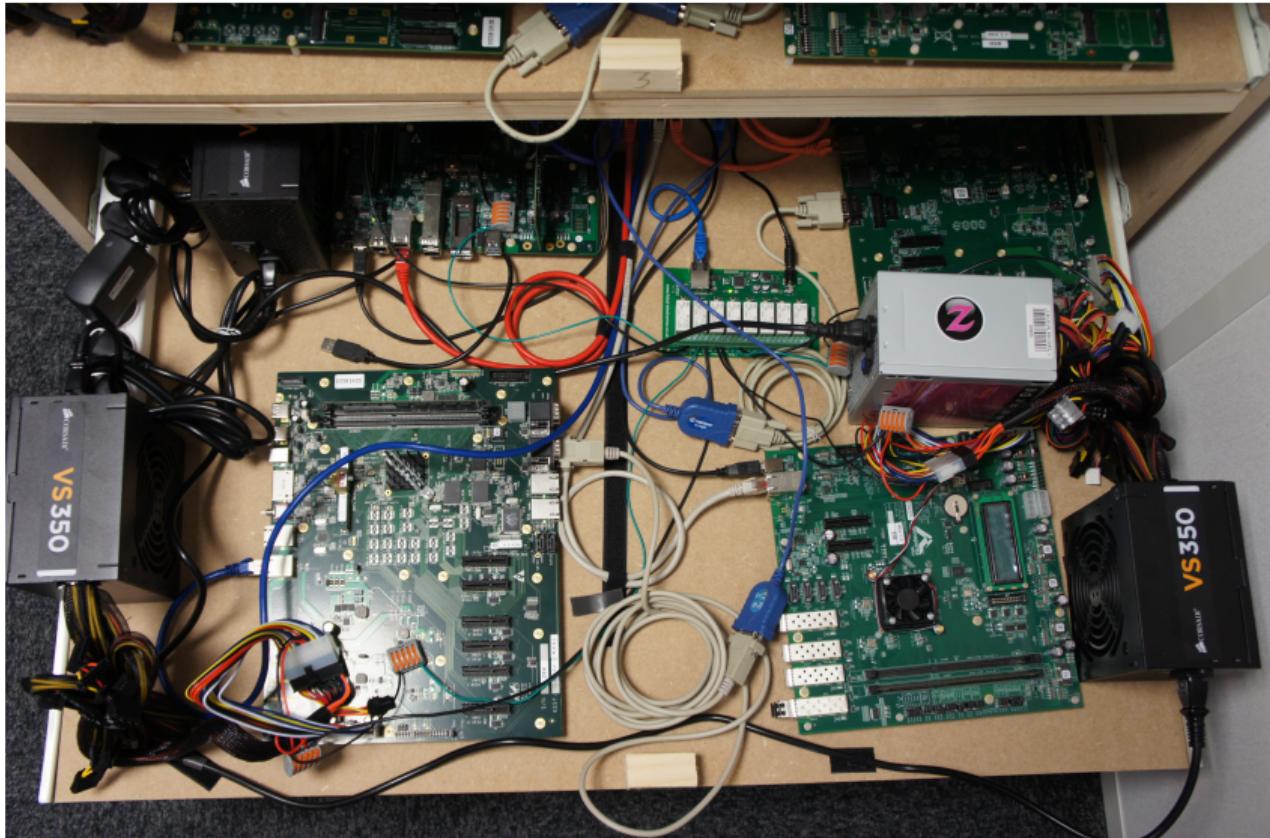

# Board farm - Big drawers

# Board farm - Big drawers - IRL

## Board farm - Some numbers

- ▶ Launched on April 25th 2016
- ▶ Currently 35 boards (estimated capacity of 50)
- ▶ 160k+ tests run
- ▶ 30+ unique devices support added to KernelCI

## Board farm - Some challenges

- ▶ Many devices connected to the LAVA server which may have limitations. We had to recompile the kernel on this machine!
- ▶ All boards are different: specific U-Boot configuration, h/w modifications needed to automate the boot, very old bootloaders (U-Boot 1.1.1 from 2004)...
- ▶ Expect everything to fail: buggy serial connections, s/w services or machine configuration...
- ▶ LAVA assumptions may not match the hardware capabilities

# Board farm - Documentation

- ▶ LAVA: <https://validation.linaro.org/static/docs/index.html>
- ▶ KernelCI: <http://wiki.kernelci.org/>
- ▶ Configure LAVA to receive tests from KernelCI:  
<https://github.com/kernelci/lava-ci#configure-lava>
- ▶ Adding a board to KernelCI:  
<https://github.com/kernelci/lava-ci#add-board-to-kernelci>
- ▶ Our articles on the matter: <http://free-electrons.com/blog/tag/lab/>

## Remote control

Quentin Schulz, Antoine Ténart

**Free Electrons**

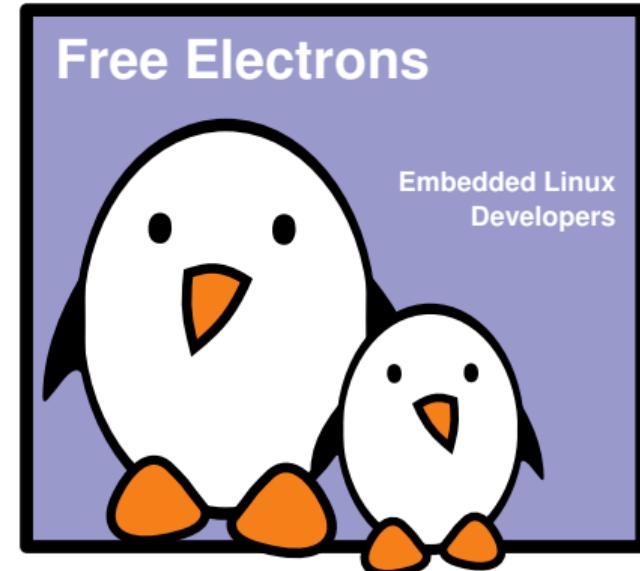

[quentin.schulz@free-electrons.com](mailto:quentin.schulz@free-electrons.com)

[antoine.tenart@free-electrons.com](mailto:antoine.tenart@free-electrons.com)

© Copyright 2004-2016, Free Electrons.

Creative Commons BY-SA 3.0 license.

Corrections, suggestions, contributions and translations are welcome!

# Why?

- ▶ Our farm knows how to handle boards, has a lot of them... but:
  - ▶ There is no direct access to the boards
  - ▶ Only tests sent to LAVA can perform actions on the boards
- ▶ Some boards owned only once
- ▶ Working remotely

## LAVA Board Overseer

- ▶ Reuses the same tools LAVA uses
- ▶ Takes full control
- ▶ Authenticates users
- ▶ Interacts with LAVA

# Lavabo reuses LAVA tools

## Lavabo's architecture

- ▶ client-server model
- ▶ server must be on the same machine as where LAVA server is hosted
- ▶ no support for multi-node LAVA
- ▶ one dedicated SSH user on the server
- ▶ one SSH key per lavabo real user
- ▶ LAVA's `connection_command` for all devices must be telnet
- ▶ no support for rootfs on NFS

# Typical workflow

```
$ lavabo list
status      job  offline_since                hostname                  offline_by
-----  -----
idle
offline      Tue Oct  4 14:23:51 2016  alpine-db_01
idle
offline      Wed Jul 13 09:13:37 2016  armada-370-db_01
offline      Wed Sep 21 15:46:56 2016  armada-3720-db_01
[...]
idle          sun5i-r8-chip_01
idle          sun8i-a33-sinlinx-sina33_01
idle          sun8i-a83t-allwinner-h8homlet-v2_01

$ lavabo reserve sun5i-r8-chip_01
$ lavabo upload mykernel sun5i-r8-chip.dtb myrootfs
File(s) successfully sent to lavabo-server.
$ lavabo reset sun5i-r8-chip_01
```

# Typical workflow

```
$ lavabo serial sun5i-r8-chip_01
Try 1 to connect to serial failed. 4 attempts remaining.
You have now access to the serial of sun5i-r8-chip_01.
Escape character is '^]'.
